

**LSAT PrepTests by date administered, with relative difficulty assessments.  
For her pleasure.**

Since October 2000, on average, testers have needed to get 61 questions right to score a 152 (the current 52nd% - the closest score to the overall median), 81 questions right to score 164 (the current 90th%), and 92 questions right for 173 (the current 99th%).

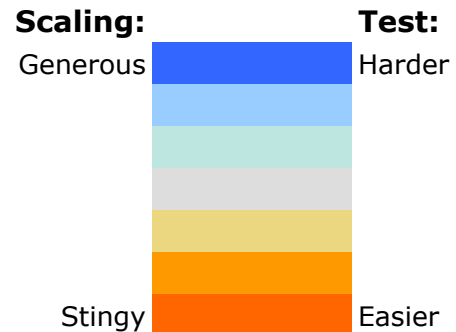

Below is a list of all LSAT PrepTests administered over the last decade, plus a measure of their relative difficulty. The higher the relative difficulty indicator, the more difficult the scaling.

For example, in December of 2005, it took 85 points to earn a score of 164. By contrast, in December of 2002, it took only 78 points to earn that same 164. This tells us that the 2002 test was relatively more difficult, so test-takers were more heavily rewarded for the questions they got right.

Perhaps counter-intuitively, a more difficult scaling indicates that the test itself was easier - it means that more people got more questions right, so that for any given scaled score, a tester would have had to earn more raw points than they would have on a test where more people missed more questions.

**So, negative numbers mean more-generous scaled scores on harder tests. Positive numbers mean stingier scales on easier tests.**
